## Layers of Rigid Core Luxury Vinyl Flooring are:

1. UV coating
2. Wear Layer
3. Decore film
4. Rigid SPC core
5. Attached underlayment

> SPC (Stone Plastic Composite) is an engineered luxury vin that combines limestone and stabilizers to create an extremely durable core. SPC flooring is up to the task in both residential and commercial settings.

> SPC Wooden flooring is the very much popular option for floors in use today. The pattern enables a plethora of colours and grains to be displayed side by side.

> SPC flooring is very easy to install. Even a layment can install the product. It comes with unique Unielic technology. This glueless locking technology for flooring works perfectly for both the long and short sides of the flooring panel. In addition to that, Unielic is a locking system that is suitable for all types of materials starting from 3.2 mm.

> SPC flooring is constructed in a way as Engineered wood that gives it greater stability and resistance to changes in temperature and humidity.

> The Good part is that it looks like hardwood flooring because the top floor is real, but all the underneath is an SPC rigid core which makes the product more better for commercial and residential uses.

## SPC core

SPC flooring contains a solid, waterproof core that won't ripple or swell no matter how much liquid you subject it to.

In traditional flooring you'll find that the core is ultra-dense with no foaming agents.

## UNICLIC TECHNOLOGY

Uniclic was the first one-piece locking profile to be introduced to the market. Over the years it became the industry's favorite locking technology thanks to its unmatched production efficiency and technical performance.

There are many advantages of uniclic locking system that makes the product more easy and simple to use.

- 1 Uniclic is fast and simple to install.
- 2 It has to be installed by an angular rotation movement.
- 3 It can also be installed in a horizontal way by snapping the planks into each other.
- 4 No unwanted gaps or spaces between floorboards.
- 5 No height differences and gives a seamless joint.
- 6 Uniclic profiles interlock very securely.
- 7 Ensures a Long- Lasting Stability.

### Advantages of SPC vinyl tiles

# How to install the SPC Flooring?

- 1 Adjust row so that the end cut is not less than 8" long.
- 2 Use shims to allow 3/8" expansion gap between the planks and the walls, or stationary interior room objects, so there is room for normal expansion and movement.
- 3 Start from the left with the tongue facing the wall, carefully place the first board in place.
- 4 Align the next piece by overlapping the short end of the first board, engage the short end at a 45° angle of the tongue and groove.
- 5 The board must be flat to engage completely. Tap lightly into place by using a rubber mallet and tapping block to firmly lock short end. Continue in this manner until reaching the final plank in the first row.
- 6 Cut the final board piece to length as needed and lay it in place.
- 7 Begin the second row with the cutpiece from the first row. If the cut piece is shorter than 8" (20cm), do not use it. Instead, begin with a new board to the left as necessary to align the edges of the end joint of the first row.

- 8 Carefully push the board down until the tongue and groove lock together on the long side and the ends.
- 9 Position the first board of the second row in place by angling it up slightly, pushing forward and interlocking the long side of the tongue. Slide the board to the left as necessary to align the edges of the end joint of the first row.
- 10 Carefully push the board down until the tongue and groove lock together on the long side and the ends.
- 11 Install second board of the second row (same as step above). Slide close to the end joint without touching it. Ensure board lays flat.
- 12 Attach a scrap piece of floor to bridge gap between ends of planks.
- 13 Tap firmly but gently on the end joint with a rubber mallet and tapping block to fully engage short end. Before moving on the next board, ensure the end joints are flush and tight.
- 14 Install the remaining boards and rows in the same container.
- 15 Cut the last board to size. If necessary, complete the tight fit by tapping the board into place with a pull bar.
- 16 Whenever practical, use cut pieces from previous rows as the starter board to reduce waste.
- 17 Maintain 8" spacing between end joints after the first rows for best appearance.
